

# SVG

Guy Lapalme

# Scalable Vector Graphics

## principes

- Éléments XML pour graphisme 2D
- Interprétés par tous les browsers *modernes*, y compris les mobiles, norme W3C (vs Flash)
- S'adapte à l'échelle de présentation
- Approche déclarative au graphisme
  - ▬ différent de canvas
- Modifiable par CSS

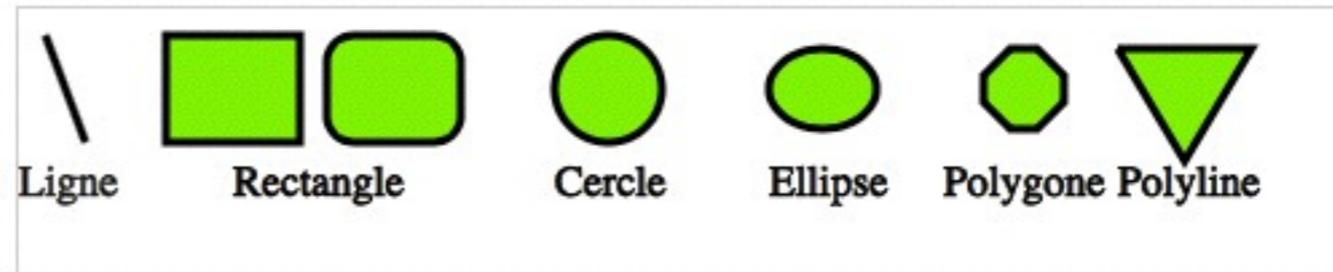

# Zone de visualisation

- Espace (canevas) de dessin (infini)
- Rendu dans une zone définie par un élément XML
  - espace de nom XML spécial
  - spécifie la largeur et hauteur du rectangle de rendu
- Espace autonome ou dans une page HTML

```
<svg xmlns="http://www.w3.org/2000/svg"
      xmlns:xlink="http://www.w3.org/1999/xlink"
      width="..." height="...">

```

# Transformations

## attribut `transform`

- suite d'énoncés
  - `translate(dx, dy)`
  - `rotate(angle)` ou `rotate(angle x, y)`
  - `scale(facteur)`
- s'applique à cet élément et ses dépendants
  - `g`, `svg`
  - `line`, `path`, `text`, ...
- possibilité de cascades

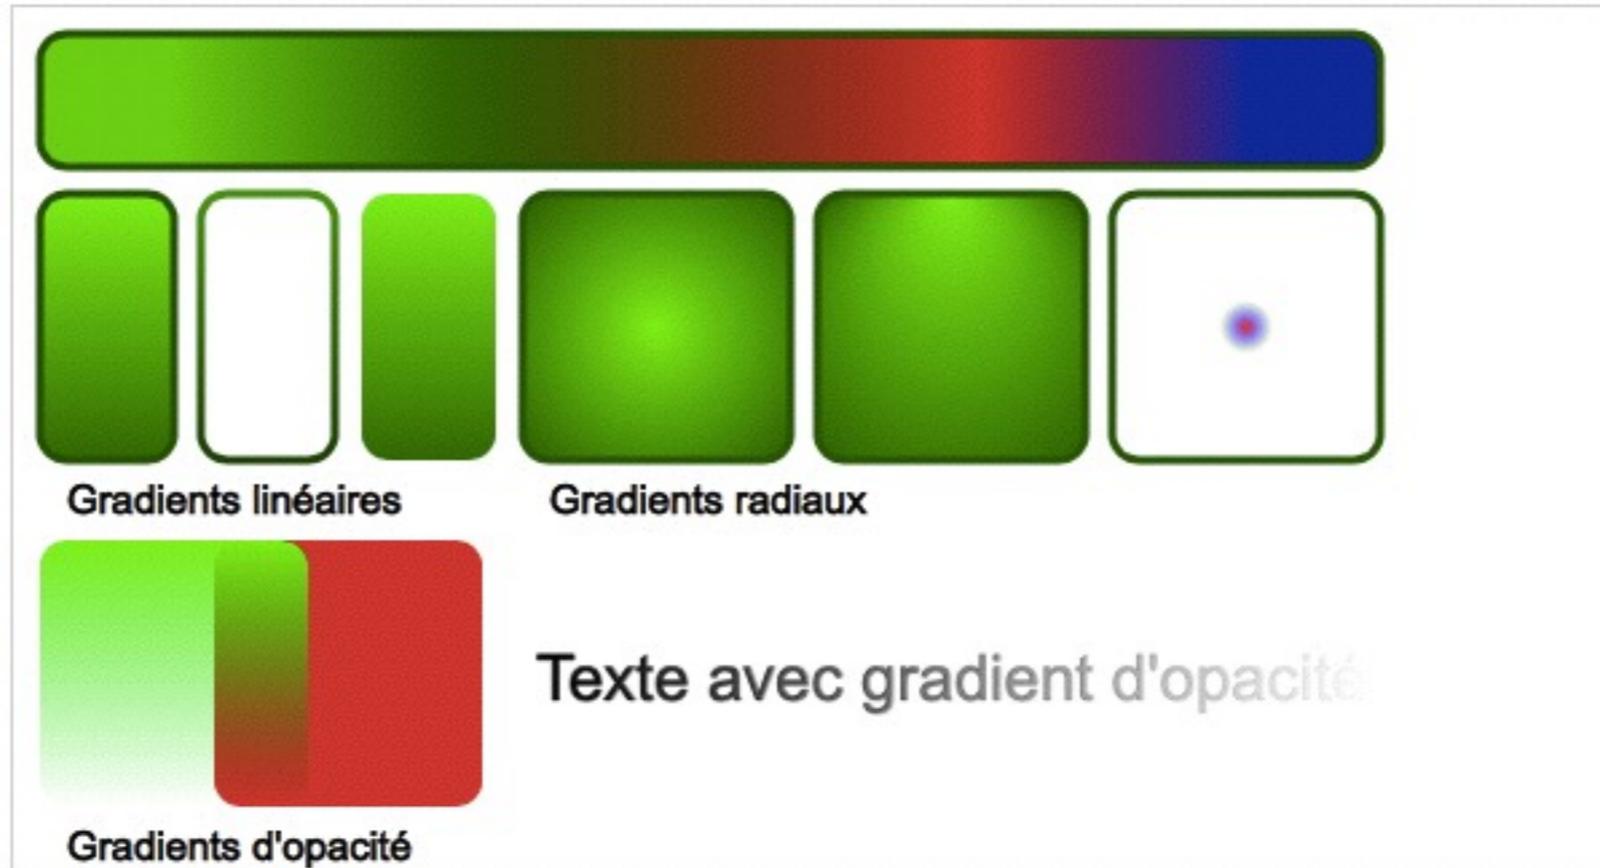

# Transformations

```
<g transform="rotate(45 100,100)">
